Living Documentation

Version 1.0.0-SNAPSHOT

Table of Contents

Chapter 1. Introduction

Database Rider aims for bringing DBUnit closer to your JUnit tests so **database testing will feel like a breeze!**. Here are the main features:

- JUnit rule to integrate with DBUnit via annotations:

```
    @Rule
    public DBUnitRule dbUnitRule = DBUnitRule.instance(jdbcConnection);①

    @Test
    @DataSet(value = "datasets/yml/users.yml")
    public void shouldSeedDataSet(){
        //database is seed with users.yml dataset
    }
```

① The rule depends on a JDBC connection.

- CDI integration via interceptor to seed database without rule instantiation;
- JSON, YAML, XML, XLS, and CSV support;
- Configuration via annotations or yml files;
- Cucumber integration;
- Multiple database support;
- Date/time support in datasets;
- Scriptable datasets with groovy and javascript;
- Regular expressions in expected datasets;
- JUnit 5 integration;
- DataSet export;
- Connection leak detection;
- Lot of examples.

The project is composed by 5 modules:

- Core: Contains the dataset executor and JUnit rule;
- CDI: provides the DBUnit interceptor;
- Cucumber: a CDI aware cucumber runner;
- JUnit5: Comes with an extension for JUnit5.
- Examples module.

Chapter 2. Summary

Scenarios			Steps							Features: 6	
Passed	Failed	Total	Passed	Failed	Skipped	Pending	Undefined	Missing	Total	Duration	Status
Manage database with Database Rider Core											
1	0	1	4	0	0	0	0	0	4	000ms	passed
Manage database with Database Rider CDI											
1	0	1	4	0	0	0	0	0	4	01s 356ms	passed
Manage database with Database Rider Cucumber											
1	0	1	5	0	0	0	0	0	5	000ms	passed
Manage database with Database Rider and JUnit 5											
1	0	1	3	0	0	0	0	0	3	000ms	passed
Dynamic data using scritable datasets											
2	0	2	7	0	0	0	0	0	7	000ms	passed
Database assertion using expected datasets											
5	0	5	16	0	0	0	0	0	16	000ms	passed
Totals											
11	0	11	39	0	0	0	0	0	39	01s 358ms	

Chapter 3. Features

3.1. Manage database with Database Rider Core

> In order to manage database state in JUnit tests
> As a developer
> I want to use DBUnit in my tests.

Database Rider Core module brings DBunit to your unit tests via JUnit rules.

Dependencies

To use it just add the following maven dependency:

```
<dependency>
   <groupId>com.github.database-rider</groupId>
   <artifactId>rider-core</artifactId>
   <version>1.0.0-SNAPSHOT</version>
   <scope>test</scope>
</dependency>
```

3.1.1. Scenario: Seed database using yml dataset

Given

The following junit rules 👍 (000ms)

```
@RunWith(JUnit4.class)
public class DBUnitRulesIt {

    @Rule
    public EntityManagerProvider emProvider =
EntityManagerProvider.instance("rules-it"); ①

    @Rule
    public DBUnitRule dbUnitRule =
DBUnitRule.instance(emProvider.connection()); ②
}
```

① EntityManagerProvider is a simple Junit rule that creates a JPA entityManager for each test. DBUnit rule don't depend on EntityManagerProvider, it only needs a **JDBC connection**.

② DBUnit rule responsible for reading `@DataSet` annotation and prepare the database for each test.

And

The following dataset 👍 (000ms)

src/test/resources/dataset/yml/users.yml

```
user:
  - id: 1
    name: "@realpestano"
  - id: 2
    name: "@dbunit"
tweet:
  - id: abcdef12345
    content: "dbunit rules!"
    date: "[DAY,NOW]"
    user_id: 1
follower:
  - id: 1
    user_id: 1
    follower_id: 2
```

When

The following test is executed: 👍 (000ms)

```
    @Test
    @DataSet(value = "datasets/yml/users.yml", useSequenceFiltering =
true)
    public void shouldSeedUserDataSet() {
        User user = (User)
EntityManagerProvider.em().createQuery("select u from User u join fetch
u.tweets join fetch u.followers where u.id = 1").getSingleResult();
        assertThat(user).isNotNull();
        assertThat(user.getId()).isEqualTo(1);
        assertThat(user.getTweets()).isNotNull().hasSize(1);
        Tweet tweet = user.getTweets().get(0);
        assertThat(tweet).isNotNull();
        Calendar date = tweet.getDate();
        Calendar now = Calendar.getInstance();

assertThat(date.get(Calendar.DAY_OF_MONTH)).isEqualTo(now.get(Calendar.
DAY_OF_MONTH));
    }
```

Source code of the above example can be found here.

Then

The database should be seeded with the dataset content before test execution 👍 (000ms)

3.2. Manage database with Database Rider CDI

In order to manage database state in **CDI** based tests
As a developer
I want to use DBUnit in a CDI test environment.

DBUnit CDI integration is done through a CDI interceptor which reads `@DataSet` to prepare database for CDI based tests.

CDI must be enabled in your test, see the following example:

```
@RunWith(CdiTestRunner.class) ①
@DBUnitInterceptor ②
public class DBUnitCDITest {

}
```

① CdiTestRunner is provided by Apache Deltaspike but you should be able to use other CDI test runners.

② Needed to activate DBUnit interceptor

Dependencies

To use this module just add the following maven dependency:

```
<dependency>
   <groupId>com.github.database-rider</groupId>
   <artifactId>rider-cdi</artifactId>
   <version>1.0.0-SNAPSHOT</version>
   <scope>test</scope>
</dependency>
```

3.2.1. Scenario: Seed database using yml dataset

Given

DBUnit interceptor is enabled in your test beans.xml: 👍 (01s 356ms)

src/test/resources/META-INF/beans.xml

```
<?xml version="1.0" encoding="UTF-8"?>
<beans xmlns="http://java.sun.com/xml/ns/javaee"
     xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:schemaLocation="http://java.sun.com/xml/ns/javaee
http://java.sun.com/xml/ns/javaee/beans_1_0.xsd">
     <interceptors>

<class>com.github.database.rider.cdi.DBUnitInterceptorImpl</class>
     </interceptors>
</beans>
```

Your test itself must be a CDI bean to be intercepted. if you're using Deltaspike test control just enable the following property in `test/resources/META-INF/apache-deltaspike.properties`:

```
deltaspike.testcontrol.use_test_class_as_cdi_bean=true
```

And

The following dataset 👍 (000ms)

src/test/resources/dataset/yml/users.yml

```
Unresolved directive in documentation.adoc -
include::../../../cdi/src/test/resources/datasets/yml/users.yml[]
```

When

The following test is executed: 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../cdi/src/test/java/com/github/database/rider/cdi/DBUni
tCDIIt.java[tags=seedDatabase]
```

Source code of the above example can be found here.

Then

The database should be seeded with the dataset content before test execution 👍 (000ms)

3.3. Manage database with Database Rider Cucumber

> In order to manage database state in BDD tests
> As a BDD developer
> I want to use DBUnit along side my BDD tests.

DBUnit enters the BDD world through a dedicated JUNit runner which is based on Cucumber and Apache DeltaSpike.

This runner just starts CDI within your BDD tests so you just have to use Database Rider CDI interceptor on Cucumber steps, here is the so called Cucumber CDI runner declaration:

```
Unresolved directive in documentation.adoc -
include::../../src/test/java/com/github/database/rider/bdd/DBUnitRulesBdd.java[]
```

As cucumber doesn't work with JUnit Rules, see this issue, you won't be able to use Cucumber runner with *Database Rider Core* because its based on JUnit rules, but you can use DataSetExecutor in `@Before`, see example here.

Dependencies

Here is a set of maven dependencies needed by Database Rider Cucumber:

Most of the dependencies, except CDI container implementation, are bring by Database Rider Cucumber module transitively.

```
<dependency>
   <groupId>com.github.dbunit-rules</groupId>
   <artifactId>cucumber</artifactId>
   <version>1.0.0-SNAPSHOT</version>
   <scope>test</scope>
</dependency>
```

Cucumber dependencies

```
Unresolved directive in documentation.adoc -
include::../../../cucumber/pom.xml[tags=cucumber-deps]
```

① You don't need to declare because it comes with Database Rider Cucumber module dependency.

DeltaSpike and CDI dependency

```
Unresolved directive in documentation.adoc -
include::../../../cucumber/pom.xml[tags=deltaspike-cdi-deps]
```

① Also comes with DBUit Rules Cucumber.

② You can use CDI implementation of your choice.

To use this module just add the following maven dependency:

3.3.1. Scenario: Seed database using Database Rider in Cucumber tests

Given

The following feature 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../examples/jpa-productivity-
boosters/src/test/resources/features/contacts.feature[]
```

And

The following dataset 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../examples/jpa-productivity-
boosters/src/test/resources/datasets/contacts.yml[]
```

And

The following Cucumber test 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../examples/jpa-productivity-
boosters/src/test/java/com/github/database/rider/examples/cucumber/Cont
actFeature.java[]
```

When

The following cucumber steps are executed 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../examples/jpa-productivity-
boosters/src/test/java/com/github/database/rider/examples/cucumber/Cont
actSteps.java[]
```

① As the Cucumber cdi runner enables CDI, you can use injection into your Cucumber steps.

② Here we use the Database Rider CDI interceptor to seed the database before step execution.

Source code for the example above can be found here.

Then

The database should be seeded with the dataset content before step execution 👍 (000ms)

3.4. Manage database with Database Rider and JUnit 5

> In order to manage database state in JUnit 5 integration tests
> As a developer
> I want to use DBUnit along side my JUnit 5 tests.

DBUnit is enabled in JUnit 5 tests through an extension named **DBUnitExtension**.

Dependencies

To use the extension just add the following maven dependency:

```
<dependency>
   <groupId>com.github.dbunit-rules</groupId>
   <artifactId>junit5</artifactId>
   <version>1.0.0-SNAPSHOT</version>
   <scope>test</scope>
</dependency>
```

3.4.1. Scenario: Seed database using Database Rider in JUnit5 tests

Given

The following dataset 👍 (000ms)

src/test/resources/dataset/users.yml

```
Unresolved directive in documentation.adoc -
include::../../../junit5/src/test/resources/datasets/users.yml[]
```

When

The following junit5 test is executed 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../junit5/src/test/java/com/github/database/rider/junit5
/DBUnitJUnit5It.java[tags=declaration;connectionField;test]
```

① Enables DBUnit;

② JUnit 5 runner;

③ As JUnit5 requires **Java8** you can use lambdas in your tests;

④ DBUnitExtension will get connection by reflection so just declare a field or a method with `ConnectionHolder` as return type.

Source code of the above example can be found here.

Then

The database should be seeded with the dataset content before test execution 👍 (000ms)

3.5. Dynamic data using scritable datasets

In order to have dynamic data in datasets
As a developer
I want to use scripts in DBUnit datasets.

Scritable datasets are backed by JSR 223. [2: Scripting for the Java Platform, for more information access the official docs here].

3.5.1. Scenario: Seed database with groovy script in dataset

Given

Groovy script engine is on test classpath 👍 (000ms)

```
<dependency>
    <groupId>org.codehaus.groovy</groupId>
    <artifactId>groovy-all</artifactId>
    <version>2.4.6</version>
    <scope>test</scope>
</dependency>
```

And

The following dataset 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/resources/datasets/yml/groovy-with-
date-replacements.yml[]
```

① Groovy scripting is enabled by `groovy:` string.

When

The following test is executed: 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/java/com/github/database/rider/ScriptRe
placementsIt.java[tags=groovy]
```

Then

Dataset script should be interpreted while seeding the database 👍 (000ms)

3.5.2. Scenario: Seed database with javascript in dataset

Javascript engine comes within JDK so no additional classpath dependency is necessary.

Given

The following dataset 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/resources/datasets/yml/js-with-calc-
replacements.yml[]
```

① Javascript scripting is enabled by `js:` string.

When

The following test is executed: 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/java/com/github/database/rider/ScriptRe
placementsIt.java[tags=javascript-likes]
```

Then

Dataset script should be interpreted while seeding the database 👍 (000ms)

3.6. Database assertion using expected datasets

In order to verify database state after test execution
As a developer
I want to assert database state with datasets.

3.6.1. Scenario: Database assertion with yml dataset

Given

The following dataset 👍 (000ms)

expectedUsers.yml

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/resources/datasets/yml/expectedUsers.ym
l[]
```

When

The following test is executed: 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/java/com/github/database/rider/Expected
DataSetIt.java[tags=expectedDeclaration;expected]
```

① Clear database before to avoid conflict with other tests.

Then

Test must pass because database state is as in expected dataset. 👍 (000ms)

3.6.2. Scenario: Database assertion with regular expression in expected dataset

Given

The following dataset 👍 (000ms)

expectedUsersRegex.yml

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/resources/datasets/yml/expectedUsersReg
ex.yml[]
```

When

The following test is executed: 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/java/com/github/database/rider/Expected
DataSetIt.java[tags=expectedRegex]
```

Then

Test must pass because database state is as in expected dataset. 👍 (000ms)

3.6.3. Scenario: Database assertion with seeding before test execution

Given

The following dataset 👍 (000ms)

user.yml

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/resources/datasets/yml/user.yml[]
```

And

The following dataset 👍 (000ms)

expectedUser.yml

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/resources/datasets/yml/expectedUser.yml
[]
```

When

The following test is executed: 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/java/com/github/database/rider/Expected
DataSetIt.java[tags=expectedWithSeeding]
```

Then

Test must pass because database state is as in expected dataset. 👍 (000ms)

3.6.4. Scenario: Failling database assertion

Given

The following dataset 👍 (000ms)

expectedUsers.yml

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/resources/datasets/yml/expectedUsers.ym
l[]
```

When

The following test is executed: 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/java/com/github/database/rider/Expected
DataSetIt.java[tags=faillingExpected]
```

Then

Test must fail with following error: 👍 (000ms)

junit.framework.ComparisonFailure: value (table=USER, row=0, col=name) expected:<[]expected user1> but was:<[non]expected user1> at org.dbunit.assertion.JUnitFailureFactory.createFailure(JUnitFailureFactory.java:39) at org.dbunit.assertion.DefaultFailureHandler.createFailure(DefaultFailureHandler.java:97) at org.dbunit.assertion.DefaultFailureHandler.handle(DefaultFailureHandler.java:223) at ...

3.6.5. Scenario: Database assertion using automatic transaction

Given

The following dataset 👍 (000ms)

expectedUsersRegex.yml

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/resources/datasets/yml/expectedUsersReg
ex.yml[]
```

When

The following test is executed: 👍 (000ms)

```
Unresolved directive in documentation.adoc -
include::../../../core/src/test/java/com/github/database/rider/Transact
ionIt.java[tags=transaction]
```

`Transactional` attribute will make Database Rider start a transaction before test and commit the transaction **after** test execution but **before** expected dataset comparison.

Then

Test must pass because inserted users are commited to database and database state matches expected dataset. 👍 (000ms)
